Absolute stereochemistry.  
 Double bond geometry as shown.

AB To improve the appearance of cosmetic preps. based on oil, fat, wax, and lacquer, stilbene compds. are used which are soluble in organic solvents whereby these organic solns. fluoresce green-blue or blue to blue-violet in daylight or ultraviolet light. Such fluorescent, soluble stilbene compds. which are non-ionically substituted in the ortho or para position relative to the ethylene bridge contain a 4,5-arylene-1,2,3-triazol-2-yl in at least one para position; advantageously, the ortho substituent is a non-ionic sulfonyl radical. Particularly favorable are compds. of the general formula: A.N.N.C6H3(R)CH:CH(R')C6H3(R'') where A is a naphthyl, lower alkoxyphenyl, or lower alkoxyalkylphenyl radical, in which 2 vicinal C atoms of the aromatic nucleus are bound to the N atoms of the triazole ring, R is H, aryloxysulfonyl, sulfamoyl, alkylsulfonyl, or an arylsulphonyl group, R' is H, lower alkoxy, aryloxysulfonyl, or a sulfamoyl group, R and R' are ortho to the ethylene group, R'' is H, lower alkoxy, naphthotriazolyl, aryloxysulfonyl, or a sulfamoyl group, at least 1 and not more than 2 of R, R', and R'' being a sulfonyl group, and R'' is para to the ethylene group. Of importance are compds. in which a modified sulfonic acid group is ortho to the ethylene linkage of the stilbene radical. 4-[(Naphtho-1',2',4,5)-1,2,3-triazol-2-yl]stilbene-2-sulfonic acid Ph ester is one among 32 stilbene compds. mentioned which are usable in lipsticks, skin creams, and similar preps.; all can be obtained according to Brit. 774,010(C.A. 51, 16562a).

AB Ventilated thermoplastic polymer foam filter rods for cigarettes and a process for their manufacture are described. The rods are characterized by the presence of cells bridged by fibrils, the rod being surrounded by a high-d. skin structure having discontinuity such as to produce a ventilation of ≥50%. The discontinuity of the skin structure is produced by solvent etching, skin abrasion, skin perforation, and skin cutting. In an example, cellulose acetate flakes are ground to a particle size of <3 mm and made into a molding powder composition by mixing 78.9 weight% undried cellulose acetate flake (5% H2O) with glycerol triacetate plasticizer (16.9 weight%) and talc nucleating agent (4.2 weight%). This mixture is dried for 2 h at 90° to a moisture level of <0.5 weight%, cooled to room temperature, and precision-fed to a twin-screw extruder through a cooled feed throat. The material is melted and vented to remove entrained air and any remaining water vapor, then addnl. heated and 3.75 weight% acetone blowing agent is added. The mixture is then cooled to 229° prior to exiting the extruder screw. Following processing steps through an extrusion block and through shaping and sizing devices, both rod skin and

end are uniformly white, with a small and uniform open cell structure, and a d. of 0.109 g/cm<sup>2</sup>. When 27-mm sections of the rod were tested, the average percentage ventilation was 38%.

CN Octadecanoic acid, 1,1',1'''-(1,2,3-propanetriyl) ester (CA INDEX NAME)				

AB A composition of at least 0.05% activity, and a vehicle of 50% difatty acid esters of polyethylene glycol, 10% of a simple or mixed solid mono, di, or triglyceride and solid or liquid petrolatum is employed in the topical application of griseofulvin. No symptoms of toxicity or local irritation were detected.

 RL: USES (Uses)  
 (cellulose acetate containing, semipermeable membranes from)  
 RN 102-76-1 CAPLUS  
 CN 1,2,3-Propanetriol, 1,2,3-triacetate (CA INDEX NAME)

AB Semipermeable cellulose membranes with high water permeability, but which retain solid impurities in H<sub>2</sub>O and are useful in water purification are prepared from skin-forming cellulose esters or ethers, solvents, swelling agents, and 0.5-9% (based on cellulose compds.) glycerol ester lipids. Thus, a solution of cellulose acetate and the glycerol ester of olive oil in Me<sub>2</sub>CO and HCONH<sub>2</sub> is poured into a container and spread over a glass plate and air dried. The membrane layer is dipped in a leaching bath containing tap water and ice and removed after 20 min to yield a 0.31-mm membrane. Tap water containing 100 ppm dissolved solids is passed through the membrane, which retains 86% of the dissolved solids. Other semipermeable membranes are prepared by using glycerol esters of cottonseed oil or glycerol triacetate as lipids.

CN	Octadecanoic acid, 1,1',1'''-(1,2,3-propanetriyl) ester (CA INDEX NAME)				

AB A mixture of glyceryl stearate 5, condensate of ethylene oxide and stearin 5, paraffin wax (microcryst.) 5, propylene glycol 5, and petrolatum 4 g. is homogenized at 70° with 100 ml. of a 2-15% aqueous solution of poly(vinyl alc.) and the mixture stirred until cold. After application, the preparation permits respiration and metabolism of the skin and prevents penetration of organic solvents, especially aliphatic and chlorinated hydrocarbons. The cosmetic can be removed with soap and water.

Absolute stereochemistry.  
 Double bond geometry as shown.

AB To improve the appearance of cosmetic preps. based on oil, fat, wax, and lacquer, stilbene compds. are used which are soluble in organic solvents whereby these organic solns. fluoresce green-blue or blue to blue-violet in daylight or ultraviolet light. Such fluorescent, soluble stilbene compds. which are non-ionically substituted in the ortho or para position relative to the ethylene bridge contain a 4,5-arylene-1,2,3-triazol-2-yl in at least one para position; advantageously, the ortho substituent is a non-ionic sulfonyl radical. Particularly favorable are compds. of the general formula: A.N.N.C6H3(R)CH:CH(R')C6H3(R'') where A is a naphthyl, lower alkoxyphenyl, or lower alkoxyalkylphenyl radical, in which 2 vicinal C atoms of the aromatic nucleus are bound to the N atoms of the triazole ring, R is H, aryloxysulfonyl, sulfamoyl, alkylsulfonyl, or an arylsulphonyl group, R' is H, lower alkoxy, aryloxysulfonyl, or a sulfamoyl group, R and R' are ortho to the ethylene group, R'' is H, lower alkoxy, naphthotriazolyl, aryloxysulfonyl, or a sulfamoyl group, at least 1 and not more than 2 of R, R', and R'' being a sulfonyl group, and R'' is para to the ethylene group. Of importance are compds. in which a modified sulfonic acid group is ortho to the ethylene linkage of the stilbene radical. 4-[(Naphtho-1',2',4,5)-1,2,3-triazol-2-yl]stilbene-2-sulfonic acid Ph ester is one among 32 stilbene compds. mentioned which are usable in lipsticks, skin creams, and similar preps.; all can be obtained according to Brit. 774,010(C.A. 51, 16562a).

PAGE 1-A

PAGE 1-B

AB Viscose filaments of smooth kidney-shaped cross-section, lower swelling degree than ordinary viscose, and increased dry and wet strength are formed by extrusion into an aqueous coagulating bath of H<sub>2</sub>SO<sub>4</sub>, Na<sub>2</sub>SO<sub>4</sub>, and ZnSO<sub>4</sub> of viscose containing 0.3% of a product formed by reaction of at least 6 moles of an alkylene oxide with 1 mole of an aliphatic acid or its ester or amide, dissolved in 6% NaOH. Thus, 0.3% of the reaction product of 1 mole ricinoleic acid with 8.6 moles ethylene oxide (I) was stirred into viscose containing 7.0% cellulose, 6.1% NaOH, and 36.6% CS<sub>2</sub> based on the cellulose weight. This altered viscose with a NaCl index of 10.4 was extruded at 53 m./min. into a bath containing 85 g. H<sub>2</sub>SO<sub>4</sub>, 300 g. Na<sub>2</sub>SO<sub>4</sub>, and 102 g. ZnSO<sub>4</sub>/l. at 50°. The filaments, withdrawn at 48 m./min., washed, and dried, showed an all-skin structure and had a swelling value of 69.2%. Other reaction products which have similar effects include those formed from: (1) 1 mole triricinolein and 26 moles I; (2) 1 mole coconut fatty acid ethanolamide and 8 moles I; and (3) 1 mole ricinoleic acid acetate and 20.4 moles I, furnishing swelling values of 73.8-5.5%.
